D.1 INTRODUCTION

In general, the planning and operation of the Canadian Treaty projects does not recognize operations not defined in the actual Treaty or Treaty Protocol. Since the Phase 1 studies were primarily focused on looking at the two fundamental river purposes defined under the Treaty, power and flood control, the studies did not include additional operations not considered under the Treaty. By approaching the Phase 1 studies from this Treaty standpoint, both the U.S. and Canadian Entities believed they created a baseline of information for comparison and to build from for future studies and for engagement with the sovereigns and stakeholders within their respective countries. However, since the Biological Opinions (BiOp) have such a strong influence on the U.S. operations, the U.S. Entity felt it was important to look at the Phase 1 study results with the fish operations included. The purpose of this appendix is to describe the modeling, methodology and criteria used in the U.S. Entity Phase 1 Supplemental studies that were done to assess the impacts to the U.S. system and fish operations when BiOp requirements were overlaid on the Phase 1 studies. The Phase 1 studies referred to in this appendix are:

1. Treaty continues post-2024 and Called Upon flood control is implemented (Study A);
2. Treaty is terminated in 2024 and Called Upon flood control is implemented (Study B); and
3. Treaty continues post-2024 with largely the same Treaty and flood control operations as today (Study C).

The purpose of this Appendix is to explore how system operations with Biological Opinion strategies performed in Called Upon years. In the Phase 1 studies, the Columbia River system was operated so as to not exceed two maximum flow objectives at The Dalles. One set of studies was performed to not exceed 450 kcfs as the maximum flood control flow objective at The Dalles. In these 450 kcfs studies, Called Upon flood control draft occurred in 52 of the 70 years being studied. The other studies where 600 kcfs was the maximum flood control flow objective at The Dalles, Called Upon draft occurred in 21 of the 70 years being studied.

Since reporting in Appendix B shows how the Phase 1 study results compared to these study result with the Biological Opinion across 70-years, and comparing the Biological Opinion studies to each other across seventy years in Appendix C, this section will examine results of the Supplemental studies in only the Called Upon years.

The C+BiOp studies are highlighted because they are being used to compare to the other studies. The C+BiOp studies do not include Called Upon flood control or effective use. They are most like the current studies being performed which incorporate the current Flood Control Operating Plan (FCOP) and current BiOp fish operations.

The following are the years for Called Upon was required for each maximum flood control flow objective:

600 kcfs Flood Control maximum flow objective: (21 Called Upon years) 1934, 38, 43, 47, 50-52, 56, 59, 65, 67, 69, 71, 72, 74, 76, 78, 81, 82, 85, 97

450 kcfs Flood Control maximum flow objective (52 Called upon years) 1932-35, 38, 39, 41-43,
46-54, 56-76, 78, 81-86, 89-91, 95-97

The following tables and graphs depict the relationship between Called Upon years only and the various fish operations modeled in the Supplemental studies.

D.5 MEETING FLOW OBJECTIVES IN CALLED UPON YEARS

Another objective of the Biological Opinions is to meet instream flow objectives at specified locations throughout the Columbia River system.

D.5.1 LOWER GRANITE

There was minimal difference in performance meeting the flow objectives at Lower Granite because Lower Granite is not downstream of Canada. Although the power operations and effective use operation has some impact at Lower Granite, it was not very noticeable in the Called Upon years.

D.5.2 PRIEST RAPIDS

Comparing the A1 and B2 450 studies to each other, and the A1 and B2 600 studies to each other, the flow objectives at Lower Granite are met the same number of years in years when Called Upon is triggered. As compared to the C+BiOp, flow objectives in the A1 and B2 studies were met less often in May. This is shown in the table below.
